

O₂ ARM

For The FALCON Altitude Chamber

ETC can replicate the switches and controls of a customer designated Oxygen Regulator. The regulator and O₂ hose component is placed between the seats for student access. The unit is hinged so the whole arm can be folded up in a stow-away position. The O₂ Regulator switches are within user's reach towards the top of the O₂ Delivery Arm. A communication link is incorporated near the switches for audio connection with the Operator/Instructor. As a result of the slimness of the equipment, visibility is not sacrificed.
