

OXYGEN TRAINING SYSTEM

For The FALCON Altitude Chamber

Recognizing the need to integrate training technologies to reflect real life conditions and experiences, ETC is developing a more flexible and compact Oxygen Training System to be incorporated into the Falcon Altitude Chamber. The sturdy yet slender design uses both sides of the student's seat. Instruments are then folded up and back into a stow-away position making chamber space more efficient. Due to its compactness more students can train at one time ensuring highest cost efficiencies and consistency in curriculum delivery. Each of the following technology offerings can stand alone or be combined providing a custom aero medically specific environment.
